## Revision - Exam style questions

Q13.
The left-hand rule can be used to identify the direction of the force acting on a current-carrying conductor in a magnetic field.
(a) Use words from the box to label Figure 1.

| current | field | force | potential difference |
| :---: | :---: | :---: | :---: |

Figure 1

Direction of $\qquad$
(b) Figure 2 shows an electric motor.

Figure 2

(i) Draw an arrow on Figure 2 to show the direction of the force acting on the wire $\mathbf{A B}$.
(a) Complete the description of the device shown below by drawing a ring around the correct line in each box.

(i) The device is being used as $\quad$| an electric motor. |
| :--- |
| a generator. |
| a transformer. |

(ii) The coil needs a flick to get started. Then one side of the coil is pushed by the

| cell |
| :--- |
| coil |
| force | and the other side is pulled, so that the coil spins.

(b) Suggest two changes to the device, each one of which would make the coil spin faster.

1. $\qquad$
$\qquad$
2. $\qquad$
$\qquad$
(c) Suggest two changes to the device, each one of which would make the coil spin in the opposite direction.
3. $\qquad$
$\qquad$
4. $\qquad$
$\qquad$

## Q15.

The circle in Figure 1 represents a straight wire carrying a current. The cross shows that the current is into the plane of the paper.

Figure 1
(a) Complete Figure 1 to show the magnetic field pattern around the wire.
(b) The magnetic flux density 10 cm from the wire is 4 microtesla.

Which of the following is the same as 4 microtesla?
Tick one box.
$4 \times 10^{-2} T$

$4 \times 10^{-3} \mathrm{~T}$

$4 \times 10^{-6} \mathrm{~T}$

$4 \times 10^{-9} \mathrm{~T}$

(c) Figure 2 shows a simple electric motor.

Figure 2

When there is a current in the coil, the coil rotates continuously.
Explain why.

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

Q16.
The figure below shows a coil and a magnet. An ammeter is connected to the coil.

The ammeter has a centre zero scale, so that values of current going in either direction through the coil can be measured.
(a) A teacher moves the magnet slowly towards the coil.

Explain why there is a reading on the ammeter.
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
(b) The table below shows some other actions taken by the teacher.

Complete the table to show the effect of each action on the ammeter reading.

| Action taken by teacher | What happens to the ammeter <br> reading? |
| :--- | :--- |
| Holds the magnet stationary and <br> moves the coil slowly towards the <br> magnet |  |
| Holds the magnet stationary within the <br> coil |  |
| Moves the magnet quickly towards the <br> coil |  |
| Reverses the magnet and moves it <br> slowly towards the coil |  |

Q17.
Figure 1 shows the construction of a simple transformer.
Figure 1

(a) Why is iron a suitable material for the core of a transformer?

Tick one box.

It is a metal. $\square$

It will not get hot.

It is easily magnetised.

It is an electrical conductor.

(b) A student makes three simple transformers, J, K and $\mathbf{L}$.

Figure 2 shows how the potential difference across the secondary coil of each transformer varies as the potential difference across the primary coil of each transformer is changed.

Figure 2

Page 8 of 9

How can you tell that transformer $\mathbf{J}$ is a step-down transformer?
$\qquad$
$\qquad$
(c) Each of the transformers has 50 turns on the primary coil.

Calculate the number of turns on the secondary coil of transformer $\mathbf{L}$.
Use the correct equation from the Physics Equations Sheet.
$\qquad$
$\qquad$
$\qquad$
Number of turns on the secondary coil $=$
(Total 5 marks)
